* Reference ranges are calculated based on the mean ± 2 standard deviations (SD). Results > 1 SD, and < 2 SDs above the mean are considered to be equivocal. An equivocal result represents the range between negative and suspicious low positive results. Results > 2 SDs are considered out of range, and positive.

** All analytes, except for Thyroid Peroxidase, Thyroglobulin, GAD, and IA-2 are tested for IgG and IgA combined. Thyroid Peroxidase (TPO) and Thyroglobulin (Tg) are tested for IgG only. GAD and IA-2 are tested for multiple autoantibodies. TPO results were obtained with the Inova Diagnostics QUANTA Lite TPO ELISA Kit. Thyroglobulin results were obtained with the Inova Diagnostics QUANTA Lite Thyroid T ELISA Kit. GAD65 results were obtained with the Kronus Glutamic Acid Decarboxylase (GAD) Autoantibody ELISA Kit. IA-2 results were obtained with the Kronus IA-2 Autoantibody (IA-2Ab) ELISA Kit. Values obtained with different manufacturers' assay methods may not be used interchangeably. The magnitude of the reported IgG levels cannot be correlated to endpoint titer. Shipping and storage criteria for specimens may vary from Inova Diagnostics' and Kronus IA-2 protocol, however, this does not appear to significantly affect patient results.

*** Ovary and Testis are tested together to avoid any confusion arising out of potential cross-reactivity.
